## Chapter 2

# Sobolev spaces

## 2.1 Interpolation inequalities

Example 2.1

$$||u||_{L^2}^2 \le ||u||_{L^2} ||u'||_{L^2} \text{ for } u \in C^{\infty}(\mathbb{R})$$
 (2.1)

*Proof.* Idea: use that  $(u^2)' = 2uu'$  and Newton-Leibniz

$$u^{2}(x) = 2 \int_{-\infty}^{x} uu' \, dy = -2 \int_{x}^{\infty} uu' \, dy$$

$$= \int_{-\infty}^{x} uu' \, dy - \int_{x}^{\infty} uu' \, dy$$

$$\leq \int_{-\infty}^{x} |u||u'| \, dy + \int_{x}^{\infty} |u||u'| \, dy$$

$$= \int_{\mathbb{R}} |u||u'| \, dy$$
(Hölder's inequality)  $\leq ||u||_{L^{2}} ||u'||_{L^{2}}$ 

Question 1

Check that 2.1 is sharp. Namely, that 2.1 becomes equality for  $u(x) = e^{-|x|}$  (u(x) is an extremal function for 2.1). Also, 2.1 is shift and scaling invariant, i.e.  $u_{\alpha}(x+h) = e^{-\alpha|x+h|}$ ,  $h \in \mathbb{R}$ ,  $\alpha > 0$  -extremals.

Example 2.2 (Interpolation inequality)

 $\Omega\text{-domain in }\mathbb{R}^n, u \in L_{p_1}(\Omega) \cap L_{p_2}(\Omega), 1 \leq p_1, p_2, <\infty, p_1 < p_2, \theta \in [0,1], \tfrac{1}{p} = \tfrac{\theta}{p_1} + \tfrac{1-\theta}{p_2}. \text{ Then }$ 

$$||u||_{L^{p}} \le ||u||_{L^{p_{1}}}^{\theta} ||u||_{L^{p_{2}}}^{1-\theta} \tag{2.2}$$

Proof.

$$\int_{\mathbb{R}} |u|^p \, \mathrm{d}x = \int_{\mathbb{R}} |u|^{\theta p} |u|^{(1-\theta)p} \, \mathrm{d}x$$

We apply Hölder's inequality with exponents  $P = \frac{p_1}{\theta p}$  and  $Q = \frac{p_2}{(1-\theta)p}$  (Note  $\frac{1}{P} + \frac{1}{Q} = \frac{\theta p}{p_1} + \frac{(1-\theta)p}{p_2} = 1$ ). Then

$$\int_{\mathbb{R}} |u|^{\theta p} |u|^{(1-\theta)p} \, \mathrm{d}x \le \left( \int_{\mathbb{R}} |u|^{p_1} \, \mathrm{d}x \right)^{\frac{1}{p}} \left( \int_{\mathbb{R}} |u|^{p_2} \, \mathrm{d}x \right)^{\frac{1}{Q}}$$

$$= \|u\|_{L^{p_1}}^{\theta} \|u\|_{L^{p_2}}^{1-\theta}$$

## 2.2 Sobolev inequalities

Example 2.3 (Sobolev inequality 1D)

 $u \in C^{\infty}([0,1])$ , want to prove the embedding  $W^{1,1}([0,1]) \subset C([0,1])$ , i.e.

$$||u||_{\mathcal{C}([0,1])} \le ||u||_{L^1([0,1])} + ||u'||_{L^1([0,1])} \tag{2.3}$$

*Proof.* By the Newton-Leibniz formula,  $u(x) - u(y) = \int_y^x u'(s) \, ds$ . Also,

$$|u(x)| \le |u(y)| + \int_0^1 |u'(s)| \, \mathrm{d}s \quad \forall x, y \in [0, 1]$$

By integration over  $y \in [0, 1]$ ,

$$|u(x)| \le \int_0^1 |u(s)| \, \mathrm{d} s + \int_0^1 |u'(s)| \, \mathrm{d} s = \|u\|_{W^{1,1}([0,1])}$$

Taking supremum with respect to  $x \in [0,1],$  we obtain  $\|u\|_{C([0,1])} \le \|u\|_{W^{1,1}([0,1])}$ 

Example 2.4 (Sobolev inequality 2D)

$$u\in C^{\infty}([0,1]^2), \text{ i.e. } \Omega=[0,1]^2, \text{ then } W^{1,1}(\Omega)\subset L^2(\Omega): \|u\|_{L^2}\leqslant \|u\|_{W^{1,1}(\Omega)}$$

*Proof.*  $\int_{\Omega} u^2(x_1, x_2) dx_1 dx_2$  should be estimated. From 2.3, we know that

$$|u(x_1, x_2)| \le \int_0^1 |u(s, x_2)| + |\partial_{x_1} u(s, x_2)| \, \mathrm{d}s := f(x_2)$$

$$|u(x_1, x_2)| \le \int_0^1 |u(x_1, s)| + |\partial_{x_2} u(x_1, s)| \, \mathrm{d}s := g(x_1)$$

Then

$$\begin{split} \int_{\Omega} u^{2} \, \mathrm{d}x &\leq \int_{0}^{1} g(x_{1}) f(x_{2}) \, \mathrm{d}x_{1} \, \mathrm{d}x_{2} \\ &= \int_{0}^{1} f(x_{2}) \, \mathrm{d}x_{2} \int_{0}^{1} g(x_{1}) \, \mathrm{d}x_{1} \\ &= \left( \int_{\Omega} |u(x_{1}, x_{2})| + |\partial_{x_{1}} u(x_{1}, x_{2})| \, \mathrm{d}x_{1} \right) \left( \int_{\Omega} |u(x_{1}, x_{2})| + |\partial_{x_{2}} u(x_{1}, x_{2})| \, \mathrm{d}x_{2} \right) \\ &\leq ||u||_{W^{1,1}(\Omega)} \end{split}$$

#### Question 2: Sobolev inequality 3D

 $u\in C^{\infty}(\bar{\Omega}), \Omega=(0,1)^3$ . Prove that  $W^{1,1}(\Omega)\subset L^{\frac{3}{2}}(\Omega)$ , i.e.

$$\|u\|_{L^{\frac{3}{2}}(\Omega)} \le \|u\|_{W^{1,1}(\Omega)} \tag{2.4}$$

Hint: first, prove that

$$\int_{\Omega} f(x_1, x_2) g(x_2, x_3) h(x_1, x_3) \, \mathrm{d}x \le \|f\|_{L^2} \|g\|_{L^2} \|h\|_{L^2}$$

and use 2.3.

#### Example 2.5

 $u \in C^{\infty}(\bar{\Omega}), \Omega = (0,1)^3$ . Then

$$||u||_{L^{6}(\Omega)} \le C||u||_{W^{1,2}(\Omega)} \tag{2.5}$$

Proof.

$$\begin{split} \int_{\Omega} |u|^6 \, \mathrm{d}x &= \int_{\Omega} (|u|^4)^{\frac{3}{2}} \, \mathrm{d}x \\ &\leqslant C \left( \int_{\Omega} |u|^4 \, \mathrm{d}x + \int_{\Omega} u^3 |\nabla u| \, \mathrm{d}x \right)^{\frac{3}{2}} \\ &(\text{by (2.3)}) \quad \leqslant C \left( \int_{\Omega} |u|^4 \, \mathrm{d}x \right)^{\frac{3}{2}} + C \left( u^3 |\nabla u| \, \mathrm{d}x \right)^{\frac{3}{2}} \\ &\leqslant C \|u\|_{L^2}^{\frac{3}{2} \cdot \theta \cdot 4} \|u\|_{L^6}^{\frac{3}{2} \cdot (1-\theta) \cdot 4} + C \|u\|_{L^6}^{\frac{3}{2} \cdot 3} \|\nabla u\|_{L^2}^{\frac{3}{2}} \\ &\left( \theta = \frac{1}{4} \right) \quad = C \|u\|_{L^2}^{\frac{3}{2}} \|u\|_{L^6}^{\frac{9}{2}} + C \|u\|_{L^6}^{\frac{9}{2}} \|\nabla u\|_{L^2}^{\frac{3}{2}} \\ &\left( \text{Young's inequality with } p = \frac{4}{5} \text{ and } q = -4 \right) \quad \leqslant \varepsilon \|u\|_{L^6}^6 + C_\varepsilon (\|u\|_{L^2} + \|\nabla u\|_{L^2})^6 \end{split}$$

Setting for example,  $\varepsilon = \frac{1}{2}$ , we obtain

$$\|u\|_{L^6(\Omega)} \leq C \|u\|_{W^{1,2}(\Omega)}$$

#### Theorem 2.1 Sobolev embeddings

- $\widehat{\textbf{1}} \ \ W^{k_1,p_1}(\Omega) \subset W^{k_2,p_2}(\Omega) \Longleftrightarrow k_1 \geq k_2 \ \text{and} \ 1 \leq p_1,p_2 < \infty, k_1 \tfrac{n}{p_1} \geq k_2 \tfrac{n}{p_2}, \Omega \subset \mathbb{R}^n.$
- ②  $W^{k,p}(\Omega) \subset C^{\alpha}(\Omega)$  if  $\alpha < k \frac{n}{p}$ . If  $\alpha$  is not an integer, then the inequality is weak.

#### Example 2.6

 $H^s(\mathbb{R}^n) \subset C(\mathbb{R}^n) \iff s > \frac{n}{2}$ 

*Proof.*  $u(x) = \int_{\mathbb{R}^n} e^{i\xi x} \hat{u}(\xi) d\xi$ 

$$\begin{split} |u(x)| & \leq \int_{\mathbb{R}^n} |\hat{u}(\xi)| \,\mathrm{d}\xi \\ & = \int_{\mathbb{R}^n} \left(1 + |\xi|^2\right)^{-\frac{s}{2}} \left(1 + |\xi|^2\right)^{\frac{s}{2}} |\hat{u}(\xi)| \,\mathrm{d}\xi \\ & (\text{H\"{o}lder's inequality}) \quad \leqslant \left(\int_{\mathbb{R}^n} \frac{1}{(1 + |\xi|^2)^s} \,\mathrm{d}\xi\right)^{\frac{1}{2}} \left(\int_{\mathbb{R}^n} \left(1 + |\xi|^2\right)^s |\hat{u}(\xi)|^2 \,\mathrm{d}\xi\right)^{\frac{1}{2}} \end{split}$$

 $\int_{\mathbb{R}^n} \frac{1}{(1+|\xi|^2)^s} \, \mathrm{d}\xi < \infty \iff s > \tfrac{n}{2}. \text{ Taking the supremum with respect to } x \in \mathbb{R}^n, \text{ we get}$ 

$$\|u\|_{C(\mathbb{R}^n)} \leq C_s \|u\|_{H^s(\mathbb{R}^n)}$$

#### Theorem 2.2 Interpolation inequalities

Let  $u \in W^{k_1,p_1}(\Omega) \cap W^{k_2,p_2}(\Omega), \theta \in [0,1], 1 \leq p_1, p_2 \leq \infty$  with  $k = \theta k_1 + (1-\theta)k_2, \frac{1}{p} = \frac{\theta}{p_1} + \frac{1-\theta}{p_2}$ . Then

$$\|u\|_{W^{k,p}} \leq C\|u\|_{W^{k_1,p_1}}^{\theta} \|u\|_{W^{k_2,p_2}}^{1-\theta}$$

#### Corollary 2.1 Particular cases

- 1.  $||u||_{H^1} \le ||u||_{L^2}^{\frac{1}{2}} ||u||_{H^2}^{\frac{1}{2}}$ 2.  $||u||_{L^p} \le ||u||_{L^p}^{\theta} ||u||_{H^2}^{1-\theta}$

#### 2.3 Spaces with zero boundary traces

#### Definition 2.1

$$\begin{split} W_0^{1,p}(\Omega) &\coloneqq \left\{u \in W^{1,p}(\Omega), \, u|_{\partial\Omega} = 0\right\} \\ &\text{Equivalent definition: } W_0^{1,p}(\Omega) = \text{``closure of } C_0^\infty(\Omega) \text{ in } W^{1,p} \text{ norm.''} \end{split}$$

#### Lemma 2.1

These two definitions are equivalent.  $u \in$  "closure":  $u = \lim_{n \to \infty} \varphi_n, \varphi_n \in C_0^{\infty}(\Omega) \implies \varphi_n|_{\partial\Omega} = 0$ . By continuity,  $u|_{\partial\Omega} = 0$ . The proof of the converse statement is more technical and is omitted.

#### 2.4 Poincaré's and Friedrich's inequalities

#### Proposition 2.1 Friedrich's inequality

Let  $\Omega$  be a bounded domain and  $u \in W_0^{1,p}(\Omega)$ . Then

$$||u||_{L^p} \leqslant C||\nabla u||_{L^p} \tag{2.6}$$

*Proof.* It is enough to prove 2.6 for  $\varphi \in C_0^{\infty}(\Omega)$ . By the Newton-Leibniz formula,

$$u(x_1, x') - u(-L, x') = u(x_1, x') = \int_{-L}^{x_1} \partial_{x_1} u(s, x') ds$$

$$\begin{split} |u(x_1,x')|^p & \leq \left(\int_{-L}^L |\partial_{x_1} u(s,x')| \, \mathrm{d}s\right)^p \\ \text{(H\"{o}lder's inequality)} & \leq C_L \int_{-L}^L |\partial_{x_1} u(s,x')|^p \, \mathrm{d}s \end{split}$$

Integration with respect to x' gives us

$$\int_{\mathbb{R}^{n-1}} |u(x_1, x')|^p \, \mathrm{d} x' \leq C_L \|\partial_{x_1} u\|_{L^p}^p$$

Finally, integrating over  $x_1 \in [-L, L]$ , we obtain

$$\|u\|_{L^p}^p \leqslant 2LC_L \|\partial_{x_1}u\|_{L^p}^p$$

Corollary 2.2 Equivalent norm in  $W_0^{1,p}(\Omega)$ 

Homogeneous norm:

$$||u||_{W_0^{1,p}(\Omega)} := ||\nabla u||_{L^p}$$

#### Note:-

 $u|_{\partial\Omega}=0$  is important! Otherwise, 2.6 will fail for  $u\equiv c$ . Since  $\nabla u$  defines u up to a constant;  $u|_{\partial\Omega}=0$  removes this constant.

#### Proposition 2.2 Poincaré inequality

Let  $\Omega$  be a bounded domain with a smooth boundary and  $\langle u \rangle \coloneqq \frac{1}{|\Omega|} \int_{\Omega} u(x) \, \mathrm{d}x = 0$ . Then

$$||u||_{L^p} \leq C||\nabla u||_{L^p}$$

## 2.5 Compactness

#### Definition 2.2: Sequential compactness

A metric space (X,d) is compact if any sequence  $\{x_n\}_{n=1}^{\infty}\subset X$  has a convergent sub-sequence, i.e. there exists  $\{x_{n_k}\}_{k=1}^{\infty}\colon \lim_{k\to\infty}x_{n_k}=x_0\in X$ 

#### Definition 2.3

A topological space X is compact if any covering of X by open sets has a finite sub-covering

#### Note:-

In metric spaces, compactness is equivalent to sequential compactness.

In general topological spaces, they are not related.

#### Theorem 2.3 Hausdorff

Let (X,d) be a metric space. Then X is compact  $\iff$  X is complete and totally bounded.

#### Definition 2.4

X is totally bounded if  $\forall \varepsilon > 0, \exists$  covering of X by finitely many  $\varepsilon$ -balls, i.e.  $X = \bigcup_{k=1}^{N} B_{\varepsilon}(x_k), N = N(\varepsilon)$  and  $\{x_k\}$  is an  $\varepsilon$ -net in X.

#### 2.5.1 Why do we need compactness?

Let X be compact and  $f: X \to Y$  be continuous, then f(X) is compact in Y. How do we solve PDEs of the form (or more general equations)?

$$F(x) = 0 (2.7)$$

1. Construct approximate solutions

$$F(x_n) = g_n$$
, where  $\lim_{n \to \infty} g_n = 0$ 

- 2. Obtain a priori estimates, i.e. that  $\{x_n\}$  is bounded in a proper space
- 3. If  $\{x_n\}$  is pre-compact and F is continuous  $\implies x = \lim_{x \to \infty} x_{n_k}$  is a solution of 2.7.

#### Theorem 2.4 Arzelà-Ascoli

Let  $\Omega \subset \mathbb{R}^n$  be a bounded domain. Then  $V \subset C(\bar{\Omega})$  is compact iff:

- 1. V is closed
- 2. V is bounded
- 3. V is equicontinuous = V has a common modulus of continuity

#### **Theorem 2.5** Arzelà-Ascoli for $L^p$

Let  $\Omega \subset \mathbb{R}^n$  be a bounded domain, (and  $\partial\Omega$  smooth, although not needed),  $K \subset L^p(\Omega), 1 \leq p < \infty$ . Then K is compact iff:

- 1. K is closed
- 2. K is bounded
- 3. K is equicontinuous in mean (possesses a joint modulus of continuity in  $L^p$ ).

#### Definition 2.5

Let  $f \in L^p(\Omega)$ ,  $1 \leq p < 1\infty$ ,  $\Omega \subset \mathbb{R}^n$  bounded  $(\partial \Omega \text{ smooth not needed})$ .  $\omega \colon \mathbb{R}^+ \to \mathbb{R}^+$  such that  $\lim_{z \to 0} w(z) = 0$  is a modulus of continuity of f in  $L_p(\Omega)$  if

$$\int_{\Omega} |f(x+h) - f(x)|^p dx \le \omega(|h|), \quad \forall h \in \mathbb{R}^n,$$

where we used the 0-extension of f outside of  $\Omega$ .

#### Corollary 2.3

Let  $K = B_1(0) \in W^{1,p}(\Omega)$ ;  $\Omega \subset \mathbb{R}^n$  is bounded,  $\partial \Omega$  is smooth,  $1 \leq p < \infty$ . Then K is pre-compact in  $L^p(\Omega)$ .

*Proof.* We need to check equicontinuity, i.e. estimate  $\int_{\Omega} |f(x+h) - f(x)|^p dx$ .

$$f(x+h) - f(x) = h \int_0^1 \nabla f(x+sh) \, \mathrm{d}s$$

Taking modulus and p-th power of both sides, we get

$$|f(x+h) - f(x)|^p \le |h| \int_0^1 |\nabla f(x+sh)|^p \, \mathrm{d}s$$

Finally, we take an integral over  $x \in \Omega$ .

$$\int_{\Omega} |f(x+h) - f(x)|^p dx \le |h| \int_{0}^{1} \int_{\Omega} |\nabla f(x+sh)|^p dx ds$$
$$\le C|h|$$

 $\omega(z) = cz$  is a joint modulus of continuity.

#### Definition 2.6

Let  $V \subset W$  be Banach spaces. Then the embedding is compact if the unit ball of V is pre-compact in W.

#### Note:-

We proved that  $W^{1,p}(\Omega) \subset L^p(\Omega)$  is a compact embedding.

#### Corollary 2.4

 $W^{1,p}(\Omega) \subset L^q(\Omega)$  is a compact embedding if  $q < q^*$ , where  $q^*$  is defined such that  $\frac{1}{q^*} = \frac{1}{p} - \frac{1}{n}$  and  $\Omega \subset \mathbb{R}^n$ ,  $\Omega$  is bounded,  $\partial \Omega$  is smooth.

*Proof.* Let us check equicontinuity.

$$||f(\cdot+h) - f(\cdot)||_{L^q} \le ||f(\cdot+h) - f(\cdot)||_{L^p}^{\theta} ||f(\cdot+h) - f(\cdot)||_{L^{q^*}}^{1-\theta}$$

since  $p < q < q^*$  and  $0 < \theta < 1$ .  $q^*$  is a critical exponent in Sobolev embeddings, indeed,  $W^{1,p}(\Omega) \subset L^q(\Omega) \implies 1 - \frac{n}{p} \geqslant -\frac{1}{q}$ . Then by corollary 2.3, we have

$$\begin{split} \|f(\cdot+h) - f(\cdot)\|_{L^p}^{\theta} \|f(\cdot+h) - f(\cdot)\|_{L^{q^*}}^{1-\theta} &\leq C|h|^{\theta} (2\|f\|_{L^{q^*}})^{1-\theta} \\ &\leq C_1 |h|^{\theta} \|f\|_{W^{1,p}}^{1-\theta} \\ &\leq C_1 |h|^{\theta} \end{split}$$

General fact:  $W^{s_1,p_1}(\Omega) \subset W^{s_2,p_2}(\Omega)$ , where  $\Omega$  is bounded,  $\partial\Omega$  is smooth. Embedding is compact  $\iff$  embedding is not critical.

## 2.6 Dual spaces

#### Definition 2.7

 $W^{-s,p}(\Omega) := \left(W_0^{s,q}(\Omega)\right)^*$  is defined as the dual space to  $W_0^{s,q}(\Omega) =$ , i.e. the space of linear continuous functionals on  $W_0^{s,q}(\Omega)$ , where  $\frac{1}{p} + \frac{1}{q} = 1$ .

### Definition 2.8

$$W^{-s,p}(\Omega) = \left\{ \text{completion of } L^p(\Omega) \text{ w.r.t } \|\ell\|_{W^{-s,p}} \coloneqq \sup_{\varphi \in \mathcal{D}} \frac{|(\ell,\varphi)|}{\|\varphi\|_{W_0^{s,q}}} \right\}$$

#### Definition 2.9

$$W^{-s,p}(\Omega) = \left\{ \ell \in \mathcal{D}'(\Omega) : \|\ell\|_{W^{-s,p}} \coloneqq \sup_{\varphi \in \mathcal{D}} \frac{|\langle \ell, \varphi \rangle|}{\|\varphi\|_{W_0^{s,q}}} \right\}$$

## **Proposition 2.3**

Definitions 2.7, 2.8 and 2.9 are equivalent.

#### Example 2.7

 $\delta(x) \in W^{-s,p}(\Omega), \Omega \in \mathbb{R}^n$ . Find s,p,n.  $\delta(x)$  is well-defined on continuous functions, so we need  $W_0^{s,q}(\Omega) \subset C(\bar{\Omega})$ . For example, n=1,p=2, then  $\delta(x) \in H^{-s}(\Omega)$  for  $s>\frac{1}{2}$ .

## Chapter 3

## Linear elliptic problems

### 3.1 Dirichlet and Neumann problems for the Laplacian

Example 3.1 (Laplace equation with Dirichlet boundary conditions)

Let  $\Omega \in \mathbb{R}^n$  be a bounded domain with  $\partial \Omega$  smooth.

$$\begin{cases} \Delta u = f \\ u|_{\partial\Omega} = 0 \end{cases} \tag{3.1}$$

Typical questions:

- 1. In what space does the solution live?
- 2. In what sense is the understood (classical / weak)?
- 3. In what sense are the boundary / initial data understood?

In ODEs, we have local existence and uniqueness theorem (for Lipschitz non-linearities), but there is not an equivalent theorem for PDEs. Therefore, we must study particular examples.

#### Definition 3.1

 $u\in W^{1,2}_0(\Omega)$  is a weak solution of 3.1 if  $\forall \varphi\in C_0^\infty(\Omega)$ 

$$-\int_{\Omega} \nabla u(x) \nabla \varphi(x) \, \mathrm{d}x = -\int_{\Omega} f(x) \varphi(x) \, \mathrm{d}x \tag{3.2}$$

Here, the boundary condition is incorporated into the choice of space  $W_0^{1,2}(\Omega) = [C_0^{\infty}(\Omega)]_{W^{1,2}(\Omega)}$  (the closure of  $C_0^{\infty}(\Omega)$  in the norm of  $W^{1,2}(\Omega)$ ).

3.2 came from the integration by parts formula. Indeed, if  $u \in C^2(\Omega) \cap C(\bar{\Omega})$ , then  $\Delta u = f$  is understood in a classical sense and

$$\int_{\Omega} \Delta u \varphi \, \mathrm{d}x = -\int_{\Omega} \nabla u \nabla \varphi \, \mathrm{d}x + \int_{\partial \Omega} \partial_n u \varphi \, \mathrm{d}s,$$

where the term  $\int_{\partial\Omega}\partial_n u\varphi\,\mathrm{d}s=0$  because  $\varphi|_{\partial\Omega}=0$ .

#### Theorem 3.1

Let  $f \in H^{-1}(\Omega) := W^{-1,2}(\Omega)$ . Then 3.1 has a unique weak solution.

*Proof.* Application of Riesz representation theorem

 $[u,u] := \int_{\Omega} \nabla u \nabla u \, dx$  is an equivalent norm on  $W_0^{1,2}(\Omega)$  (due to Friedrich's inequality). Then 3.2 can be rewritten as

$$[u,\varphi] = \int_{\Omega} f(x)\varphi(x) \, \mathrm{d}x \coloneqq \ell(\varphi)$$

Claim:  $\ell$  is a linear continuous functional on  $W_0^{1,2}(\Omega)$  (the integral should be understood as duality if we take  $f \in H^{-1}(\Omega)$  and if  $f \in L^2(\Omega)$ , this is a standard Lebesgue integral). Linearity of  $\ell$  is obvious.  $\ell$  is continuous as it is bounded:

$$|\ell(\varphi)| \le ||f||_{H^{-1}} ||\varphi||_{H^1}$$

But we obtained that 3.2 holds only for  $\varphi \in C_0^{\infty}$ , not for  $\varphi \in W_0^{1,2}(\Omega)$ . However,  $W_0^{1,2}(\Omega) = [C_0^{\infty}(\Omega)]_{W^{1,2}}$ . Then approximation arguments give that  $\forall \varphi \in H$ ,

$$[u, \varphi] = \ell(\varphi) \tag{3.3}$$

Then by Riesz representation theorem, there exists a unique  $u \in W_0^{1,2}(\Omega)$  which satisfies 3.3.

#### Example 3.2 (Laplace equation with Neumann boundary conditions)

Let  $\Omega \in \mathbb{R}^n$  be a bounded domain with  $\partial \Omega$  smooth.

$$\begin{cases} \Delta u = f \\ \partial_n u|_{\partial\Omega} = 0 \end{cases} \tag{3.4}$$

We cannot consider  $\varphi \in C_0^{\infty}(\Omega)$  as test functions, because the information about boundary conditions will be lost. Similarly,

$$\varphi\in W^{1,2}_n(\Omega)\coloneqq \{u\in W^{1,2}(\Omega)\colon\ \partial_n u|_{\partial\Omega}=0\}$$

will not work as well, since  $\partial_n u|_{\partial\Omega}$  is not defined for  $u \in W^{1,2}(\Omega)$  (since by theorem 2.1,  $C^{\infty}(\Omega) \not\subset W^{1,2}(\Omega)$ ). Instead, let us take  $\varphi \in C^{\infty}(\bar{\Omega})$  as a test function and assume that u is a classical solution. Then

$$\int_{\Omega} f \varphi \, \mathrm{d}x = \int_{\Omega} \Delta u \varphi \, \mathrm{d}x$$

$$= -\int_{\Omega} \nabla u \nabla \varphi \, \mathrm{d}x + \int_{\partial \Omega} \partial_n u \varphi \, \mathrm{d}s$$

$$= -\int_{\Omega} \nabla u \nabla \varphi \, \mathrm{d}x,$$

as  $\int_{\partial\Omega} \partial_n u \varphi \, dx = 0$  due to the boundary conditions. If we take  $\varphi(x) = 1$  as a test function, then we get

$$\int_{\Omega} f \cdot 1 \, \mathrm{d}x = -\int_{\Omega} \nabla u \nabla 1 \, \mathrm{d}x$$

Hence  $\langle f \rangle = \frac{1}{|\Omega|} \int_{\Omega} f(x) \, \mathrm{d}x = 0$  is a necessary condition for solvability.

Let us notice that all solutions of this problem differs from each other by a constant. Thus, a natural assumption to single out the solution is  $\langle u \rangle = 0$ .

#### Definition 3.2

 $u\in W^{1,2}(\Omega)\cap\{\langle u\rangle=0\}$  is a weak solution of 3.4 if  $\forall \varphi\in C^\infty(\bar\Omega)$ , we have:

$$\int_{\Omega} \nabla u \nabla \varphi \, \mathrm{d}x = -\int_{\Omega} f \varphi \, \mathrm{d}x \tag{3.5}$$

#### Note:-

The boundary conditions are now not in the definition of the space, but in 3.5.

#### Theorem 3.2

Let  $f \in L^2(\Omega) \cap \{\langle f \rangle = 0\}$ . Then 3.4 has a unique weak solution.

*Proof.* The proof is analogous to the problem with Dirichlet boundary conditions, but instead of apply Friedrich's inequality, we should apply Poincaré's inequality and use density of  $C^{\infty}(\Omega) \in W^{1,2}(\Omega)$ .
